Product Return Request — AWS Deployment Test Cases

MIS 3371 | Section 26252 | Group 3

Deployed frontend URL	https://staging.d1sg7ta5nv9m14.amplifyapp.com
API Gateway endpoint	https://iqpj8rd7ff.execute-api.us-east-1.amazonaws.com/api/returns
Lambda function	MIS3371-ReturnRequest (Node.js, execution role: LabRole)
Test cases below assume	today's date = 2026-10-31. If testing on a different day, shift each Purchase Date by the same number of days before today.

Business rules under test: (1) a return must be requested within 30 days of the purchase date; (2) the quantity returned cannot exceed the original quantity purchased; (3) a defective item valued over $200 requires supervisor approval (exactly $200 does not).

How to run each case

Open the deployed URL above. For each row, enter the listed values into the form (Customer ID / Order Number / SKU can be any text — only the fields below affect the outcome), submit, and compare the message shown under the Submit button to the Expected Outcome column.

Test Cases

#	Type	Returned / Original	Purchase Date	Reason	Item ($)	Expected Outcome
1	Valid	1 / 2	2026-10-21	No Longer Needed	$50	Approved.
2	Valid	1 / 1	2026-10-14	Defective	$250	Approved, pending supervisor review (defective item over $200).
3	Invalid	1 / 1	2026-09-16	Wrong Item	$40	Rejected: Return request is outside the 30-day return window.
4	Invalid	3 / 2	2026-10-23	Other	$60	Rejected: Return quantity exceeds the original quantity purchased.
5	Boundary (30-day window)	1 / 1	2026-10-01	Other	$75	Approved. (Exactly 30 days is still inside the window.)
6	Boundary ($200 threshold)	1 / 1	2026-10-28	Defective	$200	Approved. (Exactly $200 does not require supervisor review; only strictly over $200 does.)

Notes

All six cases were executed against the live deployed URL on 2026-10-31 and returned the Expected Outcome shown above. Cases 2 and 6 exercise the supervisor-approval rule, which is enforced only by the backend (AWS Lambda) and is not checked client-side, confirming the deployed frontend is actually communicating with the Lambda backend through API Gateway rather than validating locally.
